Mumbai, India — (+91) 84858 37871 — vlbhartiya@gmail.com
linkedin.com/in/viraj-bhartiya — virajbhartiya.com — github.com/virajbhartiya

ACHIEVEMENTS

- Winner — **ETHGlobal Lisbon 2026**, World Track.
- Winner — **Smart India Hackathon 2025**; Best Software Track — Prakalpa 2025.
- Winner — **ETHIndia 2024** (Walrus Track) and **Unfold 2024** (Nethermind, CoinDCX, Rabble).
- Top 10 Finalist — **ETHGlobal HackMoney 2026**.
- Top 10 worldwide contributor to Filecoin Lotus. Presented PDP tooling at Filecoin Dev Summit 2025.

EDUCATION

B.Tech Computer Engineering, K.J. Somaiya College of Engineering

Expected Sept 2027

EXPERIENCE

Software Engineer, SatsTerminal

Nov 2025 – Present

- Built a non-custodial AMM on Canton mainnet that has processed **\$1M+ settled volume**, **605K+ on-ledger transactions**, and **2.1M+ SDK requests**.
- Achieved **100% settlement reliability** across **34,600+ swaps** with zero stuck intents or reserve drift.
- Increased settlement throughput **3×** by batching Daml settlement execution into a single ledger submission under Canton validator limits.
- Built a non-custodial BTC-backed borrowing system using deterministic smart accounts, session keys, and Temporal workflows.

Open Source Engineer, Protocol Labs

Sept 2024 – Present

- Merged **28 PRs** across Lotus and FilOzone implementing RPC methods, revert handling, provider validation, and SDK improvements; recognized as a **top 10 worldwide Lotus contributor**.
- Built **PDP Explorer** in Go with proof-set management, event indexing, and production frontend/backend integration.

Founding Engineer, TopClub

Jan 2024 – Sept 2024

- Architected the backend on AWS Lambda maintaining **sub-300ms p95** latency for live fantasy contests, player transfers, and concurrent scoring updates.

PROJECTS

Turing Pool (ETHGlobal Lisbon Winner)

github.com/virajbhartiya/turing-pool

- Built an identity-aware AMM where verified humans receive lower fees using World ID proofs executed entirely on-chain through a custom lynch SwapVM opcode.
- Designed a dynamic pricing model maintaining a revenue-neutral **30bps** LP target while charging bots higher execution fees.

Cognia

github.com/cogniahq/cognia

- Built an enterprise AI memory platform using PostgreSQL, Qdrant, Redis, browser extensions, SDKs, and an MCP server achieving **sub-400ms retrieval latency** with deterministic cross-session memory.

Parity Protocol

github.com/theblitlabs/parity-protocol

- Built a decentralized verifiable compute network executing untrusted workloads across **20+ Docker-isolated nodes** with deterministic execution, result verification, and fault-tolerant scheduling.
- Designed sandboxed execution, staking, slashing, and reputation mechanisms enabling permissionless distributed compute for LLM inference, federated learning, and arbitrary containerized workloads.
- Developed the distributed execution engine, orchestration layer, Go SDK, and Solidity contracts powering secure task assignment and cryptographic result verification.

RaftOkay

github.com/virajbhartiya/raftokay

- Implemented the Raft consensus algorithm with leader election, log replication, snapshots, WAL-backed persistence, and automatic recovery under network partitions.

TECHNICAL SKILLS

- **Languages:** Go, Rust, TypeScript, Solidity, Daml, Python
- **Infrastructure:** PostgreSQL, Redis, Docker, AWS, Temporal, gRPC, Filecoin, Canton, EVM
